WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 4, 2024

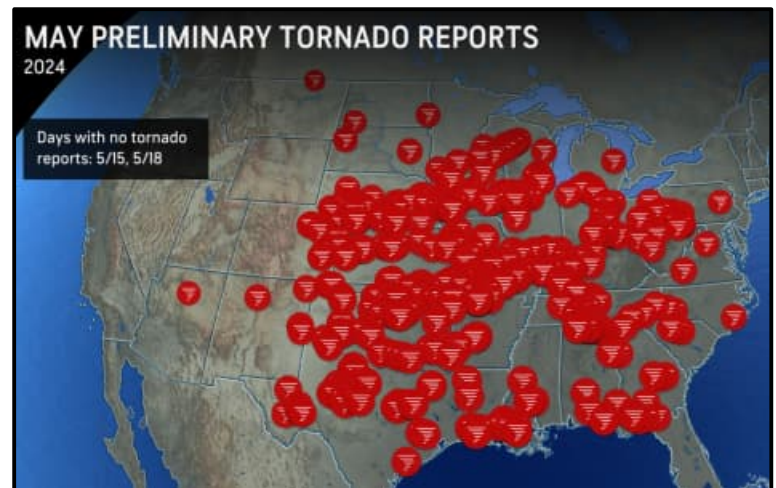

## Severe Weather Outlook Central

- Another busy week of severe weather is expected across the central, eastern US.
- Strong thunderstorms developed across the center of the nation through Monday night, bringing reports of damaging wind gusts from southern Wisconsin to northeastern Texas, northern Louisiana and central Mississippi.
- The threat for severe thunderstorms will shift eastward and northward Tuesday, with a large swath of the central U.S. from Minnesota and Wisconsin southward into northeastern Texas, Oklahoma and Arkansas in the risk zone. The severe weather risk could be maximized across Iowa.
- The stretch of stormy weather will finally come to an end across the Plains and Upper Midwest by Wednesday.

## May Tornado Recap

- A hyperactive May produced hundreds of twisters in the Plains and Midwest. While final numbers won't be out until later this month, 552 preliminary tornado reports could break the record, with the previous record being 550 in May 2003, according to the National Climatic Data Center.
- This year has produced over 1,100 preliminary tornado reports, far above the historical average of 767 through May 31. That's 39% more than in 2023 at this date.
- Tornadoes have been reported in every continental U.S. state except Nevada, Idaho, New Jersey, Delaware and the New England states.
- Texas has had the most reports, as it typically does due to its size, with 112. Iowa is not far behind at 105 reports. Compare that to 2023, when the top two tornado states were Illinois and Mississippi, and neither state had over 100 reports.
- Historically, June is the third-most active month for tornadoes across the United States, after April and May.
