WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

July 31, 2024

Tropical Activity

Atlantic - Disturbance #1

- The large, lumbering disturbance we've been following the last few days is pushing gusty tropical downpours across the northeastern Caribbean islands and surrounding waters.
- The system doesn't have any trackable center yet, so forecasts have larger-than-normal uncertainty. When and if a center does form, the location is critical to what happens later this week and early next week.
- The consensus of the latest computer forecasts is that the disturbance will pass over the mountains in Puerto Rico and the Dominican Republic on Thursday.
- If a nascent circulation forms over the abnormally warm waters north of the islands, the system is likely to be stronger or at least primed for strengthening when it reaches the vicinity of the Bahamas about Friday. It will also be more likely to take a path near or offshore of the east coast of Florida.
- If, however, the system consolidates in the waters between Haiti and Cuba, it will interact with the long Cuban mainland and has a better chance of ending up in the Gulf.
- The various computer forecast models pretty much agree on the timing of the movement of the disturbance, but not on how strong it will be when it's in the general vicinity of Florida or the northwestern Bahamas over the weekend.
- It's increasingly likely that some effects from the system will move over the southern Florida Peninsula beginning on Saturday.
