WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

April 24, 2024

Severe Weather Outlook

- Multiple disturbances will emerge from the Rockies and bring dangerous rounds of severe storms to the Plains and Mississippi Valley.
- A few strong to severe storms capable of producing large hail and strong wind gusts will form along a dryline Wednesday in parts of West Texas and Oklahoma.
- Much of the day Thursday might remain tranquil while an atmospheric lid, known as a "cap," keeps storms at bay.
- This will change in the early evening when storms are expected to break through the "cap," and a few intense supercells could form near the dryline from western Kansas into western Oklahoma and the Texas and Oklahoma panhandles.
- "Storms are going to really pop up on Thursday, Thursday night and continue to roll right through these central Plains states all across the Upper Midwest through the morning on Friday," FOX Weather Meteorologist Bob Van Dillen said. "Then behind that, we've got more storms that are going to fire up with another cold front as it drives through."
- Hail larger than baseballs is likely to be the primary initial hazard, the FOX Forecast Center said.
- Although any initial dryline storms may diminish by mid- to late evening, renewed storm development could occur overnight as a cold front overtakes the dryline from southwestern Texas into western and central Kansas and Oklahoma.
- Severe wind gusts may become an increasing threat with nighttime storms, though hail and a couple of tornadoes will also be possible.
