WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

April 22, 2021

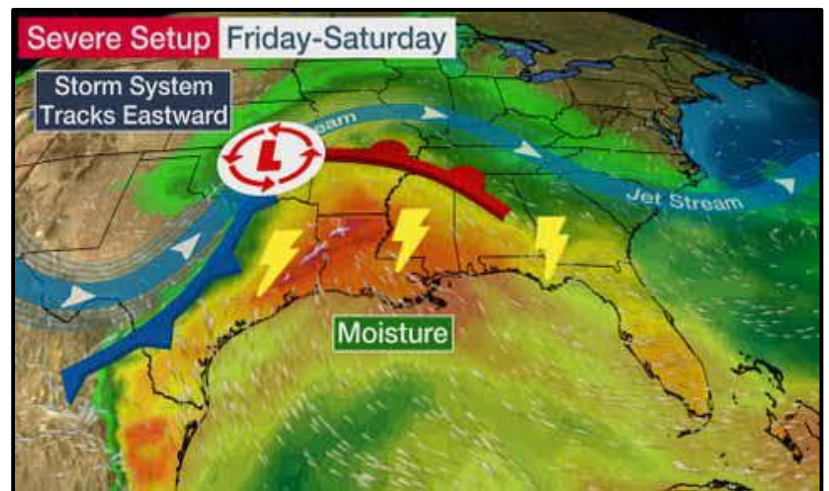

April Tornado Activity

- April's tornado pace has slower than average so far in 2021.
- NOAA's Storm Prediction Center (SPC) has tallied up nearly three dozen reports of tornadoes in the U.S. through the first half of this month. That's much below the full month average of 194 tornadoes annually over the 20-year period 2000-2019.
- The relatively low tornado report count so far this April comes on the heels of a very active March.
- There were 191 preliminary tornado reports in the U.S. last month, according to the SPC.

Severe Weather Outlook

- A threat of severe thunderstorms will return to the South as we close out the week, signaling the start of what might be a more active period for severe weather as April comes to an end.
- There has been a relative lull in widespread severe weather across much of the U.S. since an April 9 outbreak produced a combined total of 345 reports of damaging winds, large hail and tornadoes in the South.
- That should change by Friday when a potent jet-stream disturbance swings into the Southern Plains and spurs the development of a low-pressure system.
- The area of low pressure will then track eastward across the South through Saturday while tapping into Gulf of Mexico moisture.
- Widespread heavy rain and thunderstorms will likely spread across the South Friday into Saturday because of this setup.
- Some of those storms will turn severe and could produce damaging winds, large hail and at least a few tornadoes.
- The severe weather threat will begin Friday afternoon and evening.
