WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

February 7, 2023

## Severe Storms & Flooding Outlook

- Icy conditions ended January and lingered into the first few days of February across the south-central U.S to the Ohio Valley. Now, AccuWeather meteorologists say a springlike weather pattern will turn things around, with risks of both flooding and severe weather on the docket for the same area.
- "A storm will be strengthening in Texas on Tuesday, bringing the next round of wet weather and severe thunderstorms to the region," said AccuWeather Senior Meteorologist Adam Douty.
- This time, without the presence of exceptionally cold air, icy weather is not expected across most the region. Instead, some cold air following behind the storm, combined with a surge of warm air out of the Gulf of Mexico will make severe weather a possibility with the storm.
- Thunderstorms could start as early as Tuesday morning across the eastern half of Texas; however, storms are unlikely to turn severe until at least midday.
- Once the stronger thunderstorms do develop, they could linger through the nighttime hours and the threat will expand to east of Houston. Texas cities like San Antonio, Austin, Houston, and Waco are all at the risk for severe weather through Tuesday night.
- In addition to dangerous lightning, the risk of severe thunderstorms will also bring threats of damaging wind gusts of 50-60 mph. An isolated tornado cannot be ruled out either.
- As the cold front bringing the wave of severe weather shifts east on Wednesday, so too will the severe weather risk.
- Damaging winds and even a few tornadoes are possible on Wednesday and Wednesday night, and wind gusts in excess of 60 mph may be more widespread compared to Tuesday.

## Joint Preliminary Damage Assessments
