June 2, 2022

Tropical Activity

Atlantic – Disturbance 1

- The Atlantic hurricane season's first tropical depression, and potentially the first tropical storm, could form in a matter of days, AccuWeather meteorologists say.
- The budding storm is expected to slice across the Florida Peninsula with torrential rain and produce building seas and rough surf in the region.
- Meteorologists say there is already some risk that the burgeoning tropical rainstorm, which would be named Alex once it hits the 39-mph maximum sustained winds threshold for a tropical storm, could cross Florida at the end of this week and then the northern Bahamas this weekend.
- The northwest Caribbean feature, which the National Hurricane Center designated as Invest 91L on Wednesday, will be the one AccuWeather meteorologists will track as a tropical rainstorm initially. As the system comes together, a gradual increase in strength to a tropical depression and eventually a tropical storm is likely.
- At this time, AccuWeather meteorologists expect the tropical rainstorm to become a tropical depression over the southeastern Gulf of Mexico on Friday, prior to reaching the Florida Keys and the southern part of the Florida Peninsula on Friday night and Saturday.
- The system is likely to become a tropical storm while crossing Florida or perhaps just east of Florida.
- As of 2 a.m. EDT Thursday, the National Hurricane Center estimated an 80 percent chance that a tropical depression will form over the next 48 hours, with portions of western Cuba and southern Florida expected to be hit with heavy rainfall on Friday and into Saturday.
- As the storm moves into Florida, it will bring a large swath of torrential rains from the Keys to the southern and central parts of the Peninsula.
- "There is also the potential for a few tornadoes and waterspouts as the system crosses the Florida Peninsula or passes just to the south of Florida," AccuWeather Senior Meteorologist Brett Anderson said.
