WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

March 17, 2022

Severe Weather Outlook

- Hail, flash flooding, high winds and even some isolated tornadoes are possible across the South on Thursday and Friday as severe thunderstorms rumble across the region, AccuWeather forecasters say.
- The severe weather risk will shift farther to the west on Thursday after potent storms swept through areas from Louisiana to Florida and the Carolinas earlier this week.
- Although Thursday should begin quietly across Oklahoma and Texas, a strengthening area of low pressure will move from the Texas Panhandle into western and southern Oklahoma later in the day.
- Warm and moist air will interact with the low, and thunderstorms will begin to develop quickly late in the day and especially by Thursday evening.
- A zone from eastern Oklahoma through northeastern Texas and much of Louisiana will face a threat of localized flash flooding and large hail.
- The highest risk for isolated tornadoes will be in far southern Louisiana, including New Orleans. Storms in that area may also contain damaging wind gusts, and that may also be the case in far southeastern Oklahoma and far northeastern Texas.
- Thunderstorms are forecast to continue into Mississippi late Thursday night into early Friday morning, but they are also likely to be weaker than earlier in the day.
- This line may then re-intensify as it moves into Alabama, the Florida Panhandle and western Georgia later Friday morning and into Friday afternoon. The thunderstorms on Friday can produce intense rainfall, hail, damaging wind gusts and isolated tornadoes anywhere in the threat zone.
- Even though less moisture will be available, the atmosphere will remain volatile enough that a few brief tornadoes could occur on Friday afternoon and Friday evening. Otherwise, wind and hail will be a threat in western Kentucky and western Tennessee.
