WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

February 10, 2023

## Severe Weather Outlook

- Several inches of snow is forecast in locations such as Asheville, North Carolina; Bluefield, West Virginia; and Blacksburg, Virginia. Since the snow can come down hard at times in these areas and others in the southern Appalachians, roads are likely to become slushy and covered in snow, resulting in slippery and difficult travel conditions. This includes stretches of interstate highways 26, 40, 64, 77 and 81 in the region.
- The wet, clinging nature of the snow will likely cause tree limbs to bend and break, potentially taking power lines with them. This will be an added hazard on secondary highways and rural routes.
- Outside of the mountainous regions, meteorologists say the snow forecast is shaping up to be a bit tricky due to temperatures that will be near to slightly above freezing levels. This includes locations from middle Tennessee and eastern Kentucky to the northern parts of Alabama, Georgia and South Carolina, as well as the central parts of North Carolina and Virginia.
- Winds could average between 15 and 25 mph and produce gusts near 40 mph. Because of the slow-moving nature of the storm and the flow of air around it, minor tidal flooding, rough surf and beach erosion are likely to spread from northeastern North Carolina to southeastern New England from Sunday to Monday.
- Some locations that are prone to problems during nor'easters, such as the Virginia Tidewater and the barrier island communities in southern New Jersey, could experience some minor coastal flooding during high tide later this weekend to early next week.
- South of the storm track, in the storm's warm and humid sector, thunderstorm activity could become locally severe from southeastern Georgia to northern and central Florida from Friday to Saturday. The greatest threats from these storms will most likely be strong wind gusts and torrential downpours, but a couple of tornadoes or waterspouts cannot be ruled out.
