WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

August 12, 2022

Tropical Activity

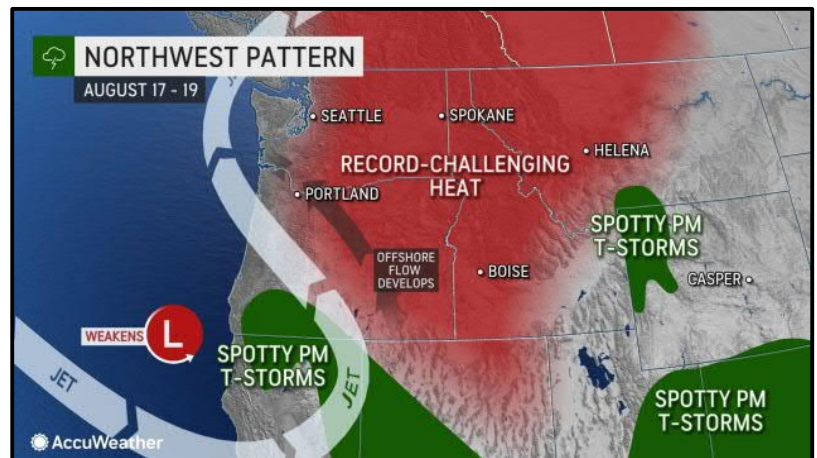

Atlantic - Disturbance 1

- A surface trough of low pressure is developing over the north-central Gulf of Mexico just offshore of southeastern Louisiana. Development, if any, of this system is expected to be slow to occur during the next couple of days as it drifts west-southwestward over the northwestern Gulf of Mexico.
- Regardless of development, locally heavy rains are possible along portions of the Texas coast through the weekend.
- Formation chance through 48 hours...low...10 percent.
- Formation chance through 5 days...low...10 percent.

Weather Outlook

- Another heat wave is in the works for the northwestern United States, AccuWeather meteorologists say.
- Not only will temperatures have the potential to approach levels set late last month, but the surging heat and widespread dry landscape could bring a significant uptick in wildfire activity.
- "An upcoming prolonged heat wave for the Northwest next week could rival temperatures reached in some locations from late July," AccuWeather Long-Range Meteorologist Alex DaSilva said.
- Temperatures are projected to surge from 5-10 degrees Fahrenheit above average early next week to 10-20 degrees or more above average beginning around the middle of next week.
- The extreme heat will likely last until Saturday west of the Cascades, but it could persist longer across the interior Northwest, according to DaSilva.
- "Widespread highs at or above 100 are likely east of the Cascades to the lower western slopes of the Rockies for at least a several-day stretch later next week," DaSilva said.
