WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 10, 2022

Tropical Activity

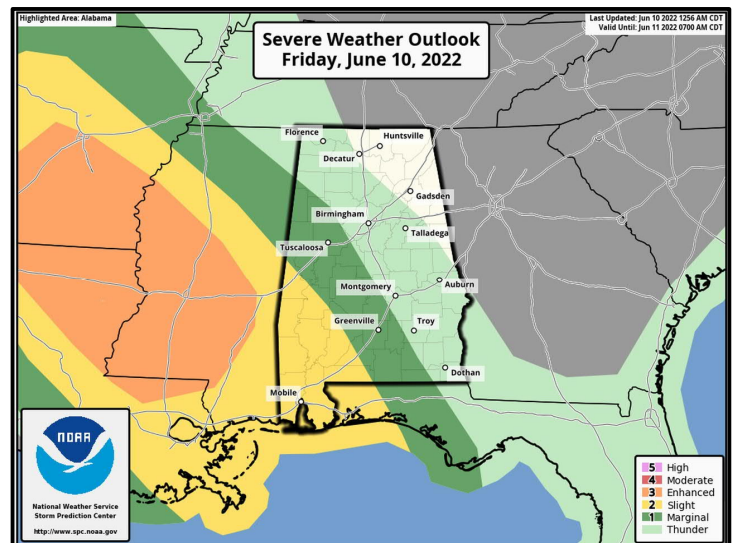

East Pacific:

- An area of warm water south of Mexico is being closely monitored by AccuWeather's team of tropical weather experts, as a new threat could emerge in the coming days.
- Tropical experts are monitoring the next area of tropical development that, as of Thursday, was in the form of a tropical wave located near Nicaragua and Costa Rica.
- This tropical wave is causing a cluster of thunderstorms to erupt across the region. Through the remainder of the week, this wave will continue to lack organization and is not expected to become a named storm in the near term.
- "Tropical development of this feature is possible this weekend or early next week between the dates of June 11 and June 15, as the tropical wave moves farther west into a zone of warm water and light wind shear," according to Douty.

Severe Storms Outlook

- Another round of strong to severe storms will be possible in parts of Alabama today, according to the National Weather Service.
- The prime time for storms will be from about 1 p.m. in west Alabama through around 9 p.m. to areas to the east.
- Southwest and west-central Alabama will be the spots to watch for the strongest storms today.
- The strongest storms could have winds capable of knocking down trees and power lines, hail, lots of lightning and very heavy rain.
- The air is saturated, so today's storms could drop a lot of rain in a short amount of time, leading to some concerns about flooding.
- NOAA's Storm Prediction Center has southwest Alabama in a Level 2 out of 5 (or slight) risk for severe weather today. A Level 2 risk means scattered severe storms will be possible.
