WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 29, 2022

Tropical Activity

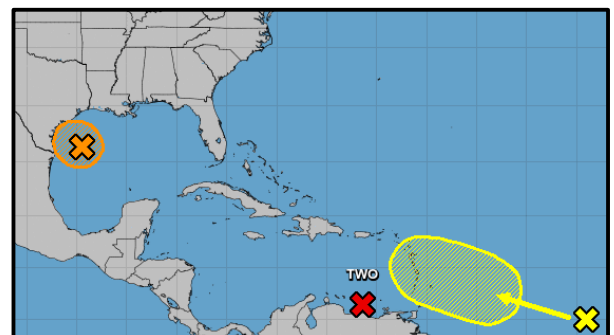

Atlantic - Disturbance 1

- Accuweather meteorologists warn that residents along the Gulf Coast should be on alert for flooding downpours as a tropical rainstorm could gain strength and make landfall this week.
- While organization and development into a tropical depression or named storm is a possibility at any time through Thursday, downpours are expected to overspread much of the western and central Gulf Coast. This rain can cause localized flash flooding but bring much-needed drought relief.
- AccuWeather meteorologists have declared this disturbance as a tropical rainstorm with it projected to track westward toward Texas through the end of the week. Although it is heading west, moisture associated with the system could go on to fuel downpours in Louisiana and Arkansas late this week.
- The tropical rainstorm was becoming better organized, based on satellite images from Tuesday afternoon.
- As tropical moisture surges into the coast it will interact with a stalled front, bringing rounds of torrential downpours this week.
- While the heaviest rain is expected on the Texas coast as the rainstorm moves over land Thursday, enhanced rainfall will be possible as far east as Georgia and the Florida Panhandle.
- Tropical impacts in the Texas region around the Gulf include flooding downpours, gusts of wind at the coast and a rough surf.
- Formation chance through 48 hours: Medium (40%)
- Formation chance through 5 days: Medium (40%)

Atlantic - Disturbance 2

- A tropical wave located over the central tropical Atlantic is producing disorganized showers and a few thunderstorms.
- Slow development of the wave is possible while it moves west northwestward for the next few days.
- The wave is forecast to move over the Windward Islands late Friday or early Saturday and then over the eastern Caribbean Sea by the weekend, where further development is unlikely due to unfavorable environmental conditions.
- Formation chance through 48 hours: Low (10%)
- Formation chance through 5 days: Low (30%)
