WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

August 8, 2022

Tropical Activity

Atlantic - Disturbance 1

- Atlantic hurricane season is attempting to wake up from its recent slumber with the potential formation of the next tropical depression or storm.
- A tropical wave has emerged into the far eastern Atlantic waters from the coast of Africa.
- This particular tropical wave is producing disorganized showers and thunderstorms right now.
- The NHC says there is a medium chance this system will form into a tropical depression as it tracks westward through the open Atlantic waters over the next five days. If it became the season's next tropical storm, it would be named Danielle.
- The Atlantic has been quiet since Tropical Storm Colin developed in early July. This is the first system that the NHC has issued an outlook for since July 13.
- While tropical waves have rolled off the African continent into the Atlantic every few days, none have had success recently due to an abundance of dry and dusty air from the Sahara.
- This dust has encircled several tropical waves over the last few weeks causing them to dry out and fall apart before they got to more hospitable conditions further west.
- Computer models are suggesting that this wave could spin up south of that dust while moving west to west northwestward.
- There is still a large bit of uncertainty on whether or not this system forms in what has recently been a rather hostile place for development.
