WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

May 12, 2023

Severe Weather Activity

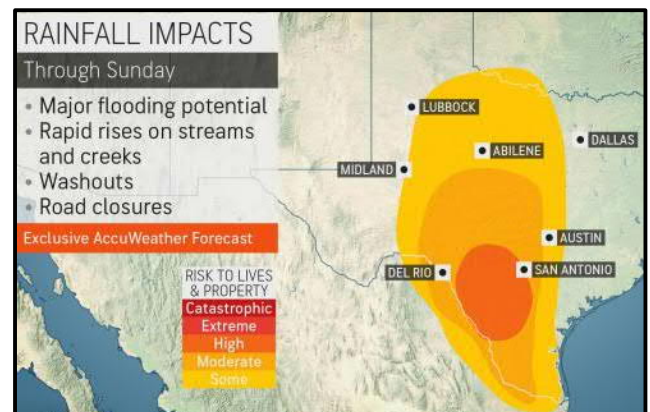

- Over a dozen tornadoes were reported in the Plains on Thursday as tornadic storms moved across the heartland.
- Tornado damage was reported in Weskan, Kansas, on Thursday evening. A rain-wrapped tornado was reported near McDonald, Kansas, on Thursday afternoon.
- Other tornado reports in Kansas included a spotter-reported spin-up in Gove County and a tornado near Edson, Kansas, about 15 miles southeast of Goodland.
- An additional tornado was confirmed in Oklahoma on Thursday evening in Grady County. Just after 7:30 p.m. CDT, another tornado was located near Cole, Oklahoma.
- In Colorado, a potential tornadic debris signature (TDS) was noted Thursday afternoon near Hale. Multiple tornadoes were reported near Arapahoe, where spotters confirmed short-lived tornadoes that were lifting and dropping again.
- A possible rain-wrapped tornado was reported in Dundy County, Nebraska. A tornado was also on the ground about 4 miles southwest of McCook, Nebraska, on Thursday.
- At least 16 preliminary tornado reports were listed by the National Weather Service's Storm Prediction Center on Thursday.

Flood Risk

Texas

- A stalled storm in Texas is set to lead to days of excessively wet weather for millions in the state, and AccuWeather meteorologists continue to emphasize that the rounds of rain and severe thunderstorms could create a very dangerous situation through the weekend.
- This influx of moisture will be so significant, that a widespread 1–2 inches of rain is expected from northeastern Mexico to southwestern Oklahoma.
- A slightly smaller, but still expansive, zone from Brownsville to Wichita Falls, Texas, is likely to have at least 2–4 inches of rain in just a few days.
- Despite how dry it has been across much of Texas, the rain can fall heavily enough over a short amount of time to cause flash flooding and rapid water rises on small streams, creeks and dangerous flooding on streets and highways.
- This could be especially true for major cities across central Texas, like San Antonio, Austin and Abilene, where half a foot of rain could fall in just a couple of days.

WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

May 12, 2023

- An even smaller area, centered near and west of San Antonio could receive closer to a foot of rain by the end of the day on Sunday.
- Thunderstorms containing dangerous winds and large, damaging hail may erupt as early as midday on Friday and continue to rumble through portions of northeastern Mexico and Texas through Friday night. The most widespread risk for these thunderstorms may center along the border between the United States and Mexico.
