WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

February 12, 2021

Spring 2021 Flood Outlook

- Despite all the snow and cold the Midwest has seen this winter, the threat for flooding along the Mississippi River is near normal, with slightly above-normal probabilities for minor flooding south of the Quad-Cities, according to the first Spring Flood Outlook issued Thursday by the National Weather Service, Davenport.
- According to the outlook, the Rock River watershed has a higher risk of flooding than other local rivers at this time.
- While portions of Iowa and northern Illinois have a snowpack, and a water equivalent is well above normal, upstream into upper the Mississippi River watershed, the snowpack and its water equivalent is averaging below normal.
- Also, near- to below-normal soil moisture over much of the region will reduce the risk for long-term flooding.
- Naturally, while rivers and streams with a deep snowpack will have an increased risk of flooding, that degree of flooding will depend on the rate of snow melt and any additional spring rains or snow.
- For the Mississippi River, the chance for minor flooding at Lock and Dam 15, Rock Island, is 54%, while the chance of moderate flooding is 45% and the probability of major flooding is 25%.
- At Muscatine, the chance of minor flooding along the Mississippi River is 65%, while the chance of moderate flooding is 42%, while the probability of major flooding is 25%.
- At Lock and Dam 14, LeClaire, the probability for minor flooding from the Mississippi is 43%, while the chances for moderate flooding are 32%, while the chance for major flooding is 18%.
- For the Rock River at Moline, the probability of minor flooding this spring is 93%, while the chances of moderate flooding is 70%. The chance for major flooding on the Rock at Moline is 50%.
- The National Weather Service will issue updated forecasts on February 25 and March 11.
