WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

May 26, 2021

Severe Weather Outlook

- Severe storms in parts of the Plains, Midwest and Northeast could produce destructive wind gusts, large hail, a few tornadoes and flash flooding over the next few days.
- On Wednesday, scattered severe storms are possible along the cold front from parts of New England into New York, eastern Ohio and much of the mid-Atlantic.
- Damaging wind gusts are the most likely threat from any severe storms in this area, but a couple of tornadoes are possible, especially from eastern New York into interior New England.
- A separate area of severe storms is expected to erupt from the Central Plains southwestward into the Texas Panhandle during the afternoon and evening. Some of those storms could pack very large hail, damaging winds and a few tornadoes.
- A leftover complex of strong to severe storms could be ongoing early Thursday in the lower Missouri Valley, or generally in an area from eastern Kansas and western Missouri into southeast Nebraska and southwest Iowa.
- More storms are likely to develop later in the day into the evening hours from the mid-Mississippi Valley southwestward into south-central and southeast Kansas, much of Oklahoma, northern Arkansas and western Texas.
- NOAA's Storm Prediction Center says supercell thunderstorms might produce large to giant hail from south-central and southeast Kansas into northern and western Oklahoma and southwest Missouri. Those storms could also have a tornado threat.
- Significant damaging wind gusts and embedded isolated tornadoes could take over as the main threats during the evening and overnight hours, especially in areas shaded darker red below.
- Flash flooding from heavy rainfall is possible in many of the same areas at risk for severe weather.
