WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

December 10, 2021

Severe Weather Outlook

- A dynamic storm system forecast to spread snow from the Rockies to the Upper Midwest will also bring the risk of severe weather to areas farther south, AccuWeather forecasters say, along with the dangerous potential for nocturnal tornadoes to break out.
- Friday may start with a few showers or even a rumble of thunder in metropolitan areas around cities such as Memphis, Tennessee, Little Rock, Arkansas, and Monroe, Louisiana.
- However, this brief lull will give the atmosphere an opportunity to gather energy as unseasonably warm and humid air will move northward from the Gulf of Mexico.
- These ingredients combined with a cold front approaching from the west will lead to explosive thunderstorm development.
- "A swath of showers and storms will develop and trail across the Ohio and Tennessee valleys and into portions of the Southeast, sparking strong to severe thunderstorms from Friday evening through the overnight hours," said AccuWeather Meteorologist Alyssa Smithmyer.
- As storms develop, they will produce a tornado risk across multiple states. Some of the locations where the risk for tornadoes will be the highest include Evansville, Indiana, Bowling Green and Paducah, Kentucky, Memphis and Nashville, Tennessee, and Greenville, Mississippi.
- The National Weather Service's Storm Prediction Center (SPC) has issued an enhanced risk for parts of the Midwest and South. More than 12 million people currently live in the area covered by the enhanced risk area, and another 12 million reside in the area under a slight risk.
- While thunder and lightning can occur as far to the north as southern Michigan and southwestern Ontario later Friday night, the risk of severe thunderstorms may extend to parts of central and northeastern Indiana and northern Ohio before daybreak Saturday.

Joint Preliminary Damage Assessments

State	Event	Number of Counties for IA		Start-End
		Requested	Completed
