WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

June 14, 2023

Severe Weather Outlook

- An outbreak of severe thunderstorms is expected across the Southeast on Wednesday, a rarity for June in this region of the U.S.
- The risk of severe weather covers more than 30 million people in northeastern Texas, eastern Oklahoma, central and southern Arkansas, northern Louisiana, Mississippi, Alabama, Georgia, northern Florida and southern South Carolina.
- The threat has been increased to a level 4 on NOAA's Storm Prediction Center's (SPC) 5-point severe thunderstorm risk category scale for northeastern Louisiana, central and southern Mississippi and Alabama and southwestern Georgia.
- In SPC records dating to 2002, this is the first time a level 4 risk has been issued in the Southeast during the summer months of June, July and August.
- The intense storms will likely come in multiple rounds through Wednesday night and could pack wind gusts of over 80 mph, hail larger than 3 inches in diameter and even a couple of EF-2 or stronger tornadoes.
- Storms will likely be scattered through the afternoon, with the most widespread storms expected from Wednesday evening into early Thursday morning.
- If the swath of wind damage spans at least 400 miles, the severe weather outbreak will meet the criteria for a derecho.
